How the Counter Works

addEventListener("click") detects when the user clicks the + or - buttons.

The counter value is updated by increasing or decreasing the stored variable.

textContent updates the displayed value in the DOM in real time after each interaction.

Button + increase the value!

Button - decrise the value!

JavaScript Counter DOM

"A simple interface featuring a central numeric display and + and - buttons to increment or decrement the counter value.”

Resources Used

Development Tools

- Visual Studio Code
- Git & GitHub

Technologies

- HTML5
- CSS3
- Vanilla JavaScript

Learning Resources

- Start2Impact Full Stack Developer course materials
- JavaScript lessons and exercises provided during the course

Development Tools

- Custom interface design
- Google Fonts (Orbitron font)
